DESCRIPTION OF JOB/HOUSING BALANCE ANALYSIS YEAR 2035 REGIONAL HOUSING PLAN FOR SOUTHEASTERN WISCONSIN October 2013

The Southeastern Wisconsin Regional Planning Commission (SEWRPC) analyzed the relationship between anticipated job wages and housing costs as part of the year 2035 Regional Housing Plan for Southeastern Wisconsin.¹ This paper describes the method used to conduct the analysis, and is primarily intended to provide information for local governments within the Region who may wish to refine the regional analysis for their community using more detailed local data. The information may also be useful for other units or agencies of government considering or conducting their own job/housing balance analysis.

Overview of Analysis

The job/housing balance analysis of the Region was based on the land use plan maps included in the comprehensive plans adopted by cities, towns, and villages with existing or planned sanitary sewer service. The job/housing balance analysis was limited to areas planned by local governments to be provided with sanitary sewer service by 2035, because the analysis was intended to determine if communities with a significant amount of existing and/or planned land uses that would accommodate jobs had also planned for workforce housing. Local governments in portions of the Region that are not served by sanitary sewer typically do not designate extensive areas for commercial and industrial land uses or for medium and high density residential land uses, which would accommodate jobs and affordable housing, respectively.

The comprehensive plan for each sewered community was analyzed separately to determine the number of lower-, moderate-, and higher-wage jobs and the number of lower-, moderate-, and higher-cost housing units that could be accommodated in the planned sewer service area included in each comprehensive plan. The number of jobs and housing units projected in each sewered community are reported on Tables 1 through 7. Map 1² summarizes the results of the regional job/housing balance analysis. The housing plan recommends that communities projected by the plan to have an imbalance between jobs and housing conduct a more detailed analysis of job wages and housing costs as part of their comprehensive plan updates.

Sub-regional housing analysis areas (sub-areas) were identified early in the planning process. The sub-areas, shown on Map 2, are generally the same as the planning analysis areas used in the regional land use plan. The factors used in determining sub-area boundaries included 2010 municipal boundaries and census tracts, existing and potential sanitary sewer and public water supply service areas, existing and potential areas served by transit, travel patterns centered on major commercial and industrial land use concentrations, and natural and human-made barriers such as environmental corridors and major transportation corridors. Sub-area data on the number of workers per household and the percentage distribution of job categories were used as part of the job/housing balance analysis.

¹ Documented in SEWRPC Planning Report No. 54, A Regional Housing Plan for Southeastern Wisconsin: 2035, March 2013.

² Map 1 shades in entire communities where sanitary sewer service is provided or planned to be provided throughout the community (excluding primary environmental corridors). Planned sewer service areas, which typically extend outside current municipal boundaries, are not shown on Map 1. Planned sanitary sewer service areas are shown on Maps 49, 52, 55, 58, 61, 64, and 67 in the regional housing plan report. The attached Maps 3 through 9 reflect areas proposed to be served by sanitary sewers in local comprehensive plans.

Basis for Analysis

The land use plan map included in the comprehensive plan adopted by each sewered community was the basis for determining the potential number of jobs and number of housing units that could be accommodated in each community. The land use plan maps adopted by sewered communities in each county are shown on Maps 3 through 9. The categories shown on community land use plan maps were converted to uniform categories for each county as part of the analysis. Table 8 lists the densities and structure types included in each residential land use category shown on Maps 3 through 9. In some cases, where a community used very broad land use categories or used categories based on structure type rather than density, the existing zoning map was used in combination with the land use plan map to determine residential densities. Appendix E in the regional housing plan report lists the specific land use categories from each local land use plan map that were included in the uniform categories shown on Maps 3 through 9.

Calculation of Number and Cost of Housing Units

Table 9 lists the residential land use categories used to determine the number of potential housing units within each cost category. Housing cost categories were based on housing densities and structure type. Generally, lower-cost housing includes multi-family dwellings and two- and single-family dwellings at existing or planned densities of 6,000 square feet or less per dwelling unit, and moderate-cost housing includes two- and single-family dwellings at densities equating to one dwelling per 6,000 to 20,000 square feet for homes constructed prior to 2000 and to densities equating to one dwelling per 6,000 to 10,000 square feet for planned residential areas. Individual communities may have access to more specific data on housing unit values from the local assessor or other sources that would allow them to "fine tune" the housing unit cost assumptions used for the regional analysis.

Total planned acres within each residential land use category shown on community land use plan maps were adjusted to subtract existing residential areas and to convert areas planned for future residential development from gross to net acreages by subtracting a percentage assumed to be developed for streets. Areas within wetlands, floodplains, and primary environmental corridors were also subtracted from the total acreages if a community land use plan map did not map these categories separately. A factor to convert net acres of planned residential development between 2010 and 2035 to the number of additional housing units that could be developed was calculated for each housing cost category based on the minimum lot sizes in each community's zoning ordinance. The highest density allowed by a community's zoning ordinance that would be consistent with a particular land use category was used to determine the number of dwelling units that could be developed. The number of existing dwellings in 2000 and the number of dwellings constructed between 2000 and 2010 were added to the calculated increase in dwelling units between 2010 and 2035. The number, type, and density of existing dwelling units was determined based on data from the year 2000 U.S. Census, Wisconsin Department of Administration data for the years between 2000 and 2010, SEWRPC's land use inventory data, and 2000 and 2010 orthophotos.

The number of total dwelling units projected to be developed within each cost category in each community by the year 2035 was calculated. The number of projected housing units was then adjusted by the average number of full- and part-time workers per household in each sub-area³ (see Table 10) to allow for a more accurate comparison of the number of jobs to housing capacity within each community. Because the intent of the analysis was to determine if housing affordable to workers within lower-, moderate-, and higher-wage job categories would be available for workers who would prefer to live in the community in which they worked, the analysis did not attempt to take into account individuals who may not live in the same community in which they work.

Calculation of Number and Wages of Jobs

The number of jobs that could be accommodated in each community was determined by adjusting the number of acres of planned commercial, industrial, and governmental and institutional land uses to subtract wetlands, floodplains, and primary environmental corridors. The number of acres in commercial, industrial, and governmental and institutional land uses from the Commission's year 2000 land use inventory was subtracted

³ Data on the number of workers per household are not available at the community level.

from the planned land use acreages to determine the incremental number of acres in each category designated on local land use plan maps. Regional standards for the number of acres needed to accommodate 100 jobs in each category⁴ were then applied to the adjusted incremental acreages to determine the number of additional jobs that could be accommodated within each community, which were added to the number of existing jobs in 2000. The resulting total number of jobs within each community was categorized into higher-, moderate-, and lower-paying jobs based on the percentage distribution of jobs by industry type in 2010 in each sub-area (shown on Table 11), the average annual wage for jobs within each industry type in each county in 2009 (shown on Table 12),⁵ and the wage ranges included within the lower-, moderate-, and higher-wage categories in each County (shown on Table 13). Individual communities may be able to refine the regional analysis based on community-specific data on the number of jobs per acre of industrial, commercial, and governmental and institutional land uses; or to develop more specific information on anticipated future jobs based on the type of businesses anticipated by the community to be developed in areas designated for industrial and commercial land uses on the community land use plan map.

Tables 1 through 7 provide a comparison of jobs that could be accommodated in each sewered community to housing units that could be accommodated. The percentage of jobs and percentage of housing units within each category were compared, rather than the total number of jobs and housing units. In almost all cases, the number of jobs that could be accommodated exceeds the number of housing units planned by each sewered community. There are several reasons for this, including:

- The job/housing balance analysis calculations did not include housing units in unsewered areas. In most cases, these housing units are or would be developed at lower densities, and would be included in the higher-cost category. The job/housing balance analysis is most concerned with helping to ensure an adequate number of housing units for workers holding lower- and moderate-wage jobs, and therefore focused on higher-density (and typically lower-cost) housing within sewered communities.
- The calculation of the total number of planned housing units within each community was based on lot sizes required by each community's zoning ordinance, and is therefore more community-specific than the Region-wide standards for workers per acre of commercial, industrial, and governmental and institutional lands that were used to determine the number of jobs that could be accommodated in each community.
- Communities often designate more land for commercial and industrial development than will be needed
 by the plan design year in order to preserve the most desirable areas for such uses from incompatible
 development.

Regional Housing Plan Recommendations Related to Job/Housing Balance

The housing plan recommends that sewered communities identified as having a potential imbalance between job wages and housing costs conduct a more detailed analysis based on specific conditions in their community as part of their comprehensive plan updates. If the local analysis confirms an existing or future job/housing imbalance, it is recommended that the local government consider changes to the comprehensive plan that would provide housing appropriate for people holding jobs in the community, thereby supporting the availability of a workforce for their community's businesses and industries. Additional modest multi-family housing is recommended in communities where the local analysis indicates a shortage of lower-cost housing in relation to lower-wage jobs. Additional modest single- or

⁴ Regional standards used were 12.0 acres per 100 industrial jobs, 4.25 acres for 100 commercial (office, retail, and service) jobs, and 24.0 acres per 100 governmental and institutional jobs. The standards for industrial and commercial jobs are those from the year 2035 regional land use plan. The standard for governmental and institutional jobs is the average number of acres for 100 jobs based on existing jobs and acres in this category in the year 2000.

⁵ The wage data shown on Table 12 are not available at the sub-area or community level.

two-family housing is recommended in communities where the local analysis indicates a shortage of moderate-cost housing in relation to moderate-wage jobs. Modest multi-family housing includes buildings of three or more housing units at a density of 10 or more housing units per acre, and 2-bedroom apartment sizes of about 800 to 850 square feet. Modest single- and two-family housing includes homes at densities equivalent to one housing unit per 10,000 square feet or smaller (four or more housing units per acre), with home sizes of about 1,200 square feet or less.

- The plan recommends that the Wisconsin Housing and Economic Development Authority (WHEDA) or other appropriate State agency conduct a Statewide job/housing balance analysis. Job/housing balance should be a criterion considered by administering agencies during the award of Federal and State economic development incentives. Incentives should be directed to local governments that can demonstrate a job/housing balance, or to communities that will use the incentive to address a job/housing imbalance.
- The plan recommends that State, County, and affected local governments work to fully implement the public transit element of the regional transportation system plan to improve connections between affordable housing and jobs. Implementation will require continued State funding and local dedicated funding.
- The plan recommends that State law be amended to prohibit the creation of new TIF districts in communities with a job/housing imbalance, as determined by a Statewide job/housing balance analysis, unless the TIF proposal includes documented steps that will be taken to reduce or eliminate the job/housing imbalance. To avoid creation of a TIF district that would cause a job/housing imbalance, the plan also recommends that State law be amended to require TIF proposals to include an analysis of the number and wages of jobs likely to be created as a result of the TIF in relation to the cost of housing in the community, and to include steps to address any potential job/housing imbalance identified through the analysis.

The job/housing balance analysis did not consider the number of jobs in a community that might be held by workers from outside the community, or the employment status of community residents. Other analyses conducted as part of the housing plan determined that households in a number of communities with a job/housing balance have high housing cost burdens despite having ample supplies of lower-cost housing and good-paying jobs. Higher household incomes and/or additional subsidized housing will be necessary to decrease high housing cost burdens in these economically challenged areas. The housing plan recommends increased economic development, job training, and education efforts to increase household incomes and decrease housing cost burdens in economically challenged areas.

Table 1 (continued)

NOTES:

Information for the Village of Genoa City is included on table 5 (Walworth County table).

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city, village, or town comprehensive plan. The analysis included projected jobs and housing units only in those communities or portions of communities planned to be served by sanitary sewerage systems by 2035.

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

^aAlthough the City of Kenosha has projected moderate- and higher-cost imbalances, there is enough lower-cost housing to accommodate lower-, moderate-, and higher-wage workers.

NOTES:

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city or village comprehensive plan.

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

Table 2 (continued)

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

^aIncludes the portion of the Village of Bayside in Ozaukee County.

^bAlthough the Cities of Cudahy, South Milwaukee, and Saint Francis have projected moderate-cost imbalances, there is enough projected lower- and moderate-cost housing to accommodate moderate-wage workers.

^cAlthough the Cities of Milwaukee and West Allis, and the Villages of Shorewood, West Milwaukee, and Whitefish Bay have projected moderate- and higher-cost imbalances, these communities have enough projected lower- and moderate-cost housing to accommodate moderate- and higher-wage workers.

^dAlthough the City of Wauwatosa has a projected higher-cost imbalance, there is enough projected lower- and moderate-cost housing to accommodate moderate- and higher-wage workers.

Table 3 (continued)

NOTES:

Information for the Villages of Bayside and Newburg is included on Table 2 (Milwaukee County) and Table 6 (Washington County), respectively.

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city or village comprehensive plan. The analysis included projected jobs and housing units only in those communities or portions of communities planned to be served by sanitary sewerage systems by 2035.

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

NOTES:

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city, village, or town comprehensive plan. The analysis included projected jobs and housing units only in those communities or portions of communities planned to be served by sanitary sewerage systems by 2035.

Table 4 (continued)

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

^aIncludes that portion of the City of Burlington in Walworth County.

^bAlthough the City of Racine has projected moderate- and higher-cost imbalances, there is enough lower-cost housing to accommodate lower-moderate-, and higher-wage workers.

^cAlthough the Village of Sturtevant has a projected higher-cost imbalance, there is enough moderate-cost housing to accommodate moderate- and higher-wage workers.

NOTES:

Information for the Village of Mukwonago is included on Table 7 (Waukesha County).

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city, village, or town comprehensive plan. The analysis included projected jobs and housing units only in those communities or portions of communities planned to be served by sanitary sewerage systems by 2035.

Table 5 (continued)

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

^aIncludes that portion of the City of Whitewater planned urban service area located in Jefferson County.

^bPortions of the Town of Bloomfield incorporated as the Village of Bloomfield in December 2011.

^cIncludes that portion of the Village of Genoa City planned urban service area located in Kenosha County.

^dAlthough the Cities of Delavan, Elkhom, Lake Geneva, and Whitewater are projected to have a higher-cost imbalance, there are enough projected lower- and moderate-cost housing units to accommodate higher-wage workers.

NOTES:

The analysis is based on the sub-area average of workers per household and the percentage of lower-, moderate-, and higher-wage jobs in the sub-area. The projected number of jobs and housing units in each community is based on an analysis of the land use plan map in the city, village, or town comprehensive plan. The analysis included projected jobs and housing units only in those communities or portions of communities planned to be served by sanitary sewerage systems by 2035.

Table 7 (continued)

Lower-wage jobs include those with a 2009 average annual wage of 80 percent or below the 2009 average annual wage for all jobs in the County. Moderate-wage jobs include those with a 2009 average annual wage between 80 and 135 percent of the 2009 average annual wage for all jobs in the County. Higher-wage jobs include those with a 2009 average annual wage of 135 percent or more of the 2009 average annual wage for all jobs in the County. The wage thresholds by County are shown on Table 143 in Chapter VIII of the Regional Housing Plan.

A lower-cost job/housing imbalance is projected in communities with a higher percentage of lower-wage jobs than lower-cost housing. A moderate-cost job/housing imbalance is projected in communities with a higher percentage of moderate-wage jobs than moderate-cost housing. A community has an imbalance if there is a housing-to-job deficit of 10 or more percentage points.

^aAreas designated as "Urban Reserve" in the City of Oconomowoc Comprehensive Plan were not included in the job/housing balance analysis.

blincludes that portion of the Village of Lac La Belle planned urban service area in Jefferson County.

^cIncludes that portion of the Village of Mukwonago planned urban service area in Walworth County.

Table 8

DESCRIPTION OF RESIDENTIAL LAND USE CATEGORIES USED FOR STANDARDIZED LAND USE PLAN MAPS FOR SEWERED COMMUNITIES IN SOUTHEASTERN WISCONSIN COUNTIES

County	Land Use Plan Category	Description
Kenosha	Suburban Density Residential	Single-family residential development at densities equivalent to 40,000 square feet to 4.9 acres per dwelling
	Low Density Residential	Single-family residential development at densities equivalent to 10,001 to 39,999 square feet per dwelling
	Medium Density Residential ^a	Single-family residential development at densities equivalent to 6,000 to 10,000 square feet per dwelling
	High Density Residential ^a	Multi-family or a mix of housing structure types with an average density of less than 6,000 square feet per dwelling
	Mixed Use ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Milwaukee	Suburban Density Residential	Single-family residential development at densities equivalent to 1.0 to 4.9 acres per dwelling
	Low Density Residential	Single-family residential development at densities equivalent to 20,000 to 43,559 square feet per dwelling
	Medium-Low Density Residential	Single-family residential development at densities equivalent to 10,001 to 19,999 square feet per dwelling
	Medium Density Residential ^a	Single-family residential development at densities equivalent to 10,000 square feet or less per dwelling
	Medium-High Density Residential ^a	Two-family, townhouse, or a mix of single- and two- family development at an average density of less than 10,000 square feet per dwelling
	High Density Residential ^a	Multi-family or a mix of housing structure types with an average density of less than 10,000 square feet per dwelling
	Mixed Use Including Residential ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Ozaukee	Suburban Density Residential	Single-family residential development at densities equivalent to 1.0 to 4.9 acres per dwelling
	Medium Density Residential	Single- and two-family residential development at densities equivalent to 10,000 to 43,559 square feet per dwelling
	Medium-High Density Residential ^a	Two-family or a mix of single- and two-family development at an average density of less than 10,000 square feet per dwelling
	High Density Residential ^a	Multi-family or a mix of housing structure types that includes multi-family with an average density of less than 10,000 square feet per dwelling
	Traditional Neighborhood Development and Mixed Use ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Racine	Suburban Density Residential	Single-family residential development at densities equivalent to 1.5 to 2.9 acres per dwelling
	Low Density Residential	Single-family residential development at densities equivalent to 19,000 square feet to 1.49 acres per dwelling

Table 8 (continued)

County	Land Use Plan Category	Description
Racine (continued)	Medium Density Residential	Single-family residential development at densities equivalent to 10,001 to 18,999 square feet per dwelling
	Medium-High Density Residential ^a	Single-, two-, and multi-family dwellings with an average density of 6,200 to10,000 square feet per dwelling
	High Density Residential ^a	Single-, two-, and multi-family dwellings with an average density of less than 6,200 square feet per dwelling
	Mixed Use ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Walworth	Suburban Density Residential	Single-family residential development at densities
	Low Density Residential	equivalent to 1.0 to 4.9 acres per dwelling Single-family residential development at densities equivalent to 20,000 to 43,559 square feet per dwelling
	Medium-Low Density Residential	Single-family residential development at densities equivalent to 10,000 to 19,999 square feet per dwelling
	Medium Density Residential ^a	Single-family residential development with an average density of less than 10,000 square feet per dwelling
	Medium-High Density Residential ^a	Two-family, townhouse, or a mix of single- and two- family development at an average density of less than 10,000 square feet per dwelling
	High Density Residential ^a	Multi-family or a mix of housing structure types with an average density of less than 10,000 square feet per dwelling
	Mixed Use ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Washington	Suburban Density Residential	Single-family residential development at densities
	Medium Density Residential	equivalent to 1.0 to 4.9 acres per dwelling Single-family and two-family residential development at densities equivalent to 10,000 to 43,559 square feet per dwelling
	Medium-High Density Residential ^a	Single- and two-family development at an average density of less than 10,000 square feet per dwelling
	High Density Residential ^a	Multi-family or a mix of housing structure types with an average density of less than 10,000 square feet per dwelling
	Mixed Use ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density
Waukesha	Suburban Density Residential	Single-family residential development at densities
	Low Density Residential	equivalent to 1.5 to 4.9 acres per dwelling Single-family residential development at densities equivalent to 20,000 square feet to 1.4 acres per dwelling
	Medium Density Residential	Single-family residential development at densities equivalent to 10,000 to 19,999 square feet per dwelling
	Medium-High Density Residential ^a	Single-, two-, and multi-family dwellings with an average density of 6,000 to 9,999 square feet per dwelling
	High Density Residential and Housing for the Elderly ^{a, b}	Single-, two-, and multi-family dwellings with an average density of less than 6,000 square feet per home
	Mixed Use (Residential and Commercial) ^a	A mix of residential, commercial, and institutional uses. Residential uses are typically high or medium-high density

Table V-8 (continued)

Source: SEWRPC.

^aLand use categories identified as suitable for accommodating new affordable housing on Maps 3 through 9.

^bThe Villages of Hartland and Nashotah have identified existing areas developed for housing for the elderly on the Village land use plan maps. No vacant land in Waukesha County has been designated in comprehensive plans adopted by sewered communities specifically for the development of housing for the elderly.

Table 9

RELATIONSHIP BETWEEN LAND USE CATEGORIES AND HOUSING UNIT COST CATEGORIES USED FOR JOB/HOUSING BALANCE ANALYSIS

	· · · · · · · · · · · · · · · · · · ·		
County	Land Use Categories Included in Lower-Cost Housing Category ^a	Land Use Categories Included in Moderate-Cost Housing Category ^a	Land Use Categories Included in Higher-Cost Housing Category ^a
Kenosha	High Density Residential Mixed Use ^b	Medium Density Residential	Suburban Density Residential Low Density Residential
Milwaukee	High Density Residential Mixed Use Including Residential ^b	Medium Density Residential Medium-High Density Residential	Suburban Density Residential Low Density Residential Medium-Low Density Residential
Ozaukee	High Density Residential Mixed Use ^b	Traditional Neighborhood Development Medium-High Density Residential	Suburban Density Residential Medium Density Residential
Racine	High Density Residential Mixed Use ^b	Medium-High Density Residential	Suburban Density Residential Low Density Residential Medium Density Residential
Walworth	High Density Residential Mixed Use ^b	Medium Density Residential Medium-High Density Residential	Suburban Density Residential Low Density Residential Medium-Low Density Residential
Washington	High Density Residential Housing for the Elderly Mixed Use ^b	Medium-High Density Residential	Suburban Density Residential Medium Density Residential
Waukesha	High Density Residential Housing for the Elderly Mixed Use (Residential and Commercial) ^b	Medium-High Density Residential	Suburban Density Residential Low Density Residential Medium Density Residential

^aLand use plan maps from comprehensive plans adopted by communities with sanitary sewer service, converted to uniform land use categories, are shown on Maps 3 through 9. Table 8 describes the densities and structure types included in each residential land use category.

Source: SEWRPC.

^bIn all counties, it was assumed that 75 percent of the area designated for development of mixed commercial and residential uses would be developed with high-density residential uses and 25 percent would be developed with commercial uses.
